| 38 |  |  | \$1,000 | \$1,000 |

\$1,000 \$1,000

## Snow Ball Method Example

After reviewing your monthly budget and expenses, determine how much are you able to pay on your debts each month.

Every household will have different dollar amounts they can afford. If you can afford to pay more on your debts each month, thats great! If less, thats great too! Just make sure you really understand your budget to be able to figure what you can afford each month.

For this chart example we are going to say that we have $\$ 1,000$ per month available to pay on our debts.

With all of our monthly minimum payments calculated, we are left with $\$ 645$ to pay on our first debt!

Keep in mind that this is just an example, every household has different budgets and different debts.

Tip: If you make a bonus at work or when you get your tax returns, why not throw that extra money into your debts!

> Debt Paid off in just 38 months!
